

Strategic & Operational Support for Judicial Bodies

Efficient data management and transparent reporting

The Austrian Reporting Platform provides a business intelligence (BI) solution for Austria's judicial authorities, supporting ministries, courts, and public prosecutors through a central platform for reporting relevant data. This solution enables efficient administration, greater transparency, and data-driven decision-making within the justice system. It includes a wide range of reports on topics such as courts, public prosecutors, human resources, and administrative oversight. Data is aggregated from various core systems of the Federal Ministry of Justice (BMJ) as well as from the public sector HR system and processed in a specially developed data warehouse (DWH).

How it works

The Austrian Reporting Platform brings together various applications, each with a specific focus: In the judiciary sector, the platform supports the administration and reporting needs of courts, public prosecutors, and ministries through a tailored business intelligence solution.

It is based on a flexible BI system specifically developed for judicial authorities. It accesses data from various justice systems and the public sector, preparing it for clear and concise presentation. Through the application, users can view reports on a range of topics, including courts, public prosecutors, and HR. The flexibility of the platform allows for easy adaptation and development of applications tailored to the specific needs of the judicial authorities. A standardized user interface (UI/UX) ensures simple and user-friendly operation.

Reports can be viewed by individual users or by specific roles within the justice system with authorized access. The system also supports the development of applications closely aligned with the specific requirements and resources of the BMJ, ensuring high responsiveness and adaptability.

The Big Picture

The Austrian Reporting Platform helps judicial authorities manage their operations efficiently and make well-informed decisions based on up-to-date data. It increases transparency within administrative activities and fosters data-driven governance based on accurate and timely information. By standardizing and automating reporting processes, the platform not only enhances efficiency but also ensures the quality and consistency of information. It thus contributes to a modern and transparent administration that meets the demands of a digital and interconnected society.

Quick Facts

- Solution area: **Organisations, Processes, Quality assurance and certification**
- Administrative level: **State, Federation**
- Solution process: **Judiciary**
- Technology: **Artificial Intelligence, Information technology, Platform technology**
